

# systems IV®

Model H200N addresses the number one ice maker water problem of hard scale buildup that either reduces ice production or stops ice production. This requires costly ice maker maintenance and usually necessitates buying costly ice while waiting for the ice maker to return to operation.

Model H200N also controls other potential ice maker water problems of corrosion, chlorine and sediment.

Model H200N does not stop bacterial slime and mold growth in an ice maker. Slime can be controlled by adding the affordable Bio-Clean II system to the H200N filter. The Bio-Clean II also controls more high scale problems in an ice maker. Both the H200N and the Bio-Clean II systems control most water problems that effect the performance and health considerations of an ice maker.
